

Intern – Robotics Data Operations | SmartOne AI · Montréal

Full-time · 6 to 9 months

We're building a new practice around robotics data collection and annotation, and we're looking for a sharp, curious intern to help us shape it from the ground up.

This isn't a "shadow and observe" internship. You'll be doing real scoping work that feeds directly into a new service offering — researching the competitive landscape, mapping what it takes to deliver end-to-end robotics data solutions, and working hands-on with our internal teams to translate that into something we can bring to market.

What you'll work on

Market benchmarking — mapping what platforms, tools, and specialist players are doing in robotics data collection and annotation, where the gaps are, and what robotics companies actually need from a data operations partner at various stages of model development.

Internal capability assessment — working from our existing robotics annotation program and documentation to evaluate what we already do well, what's missing, and what needs to be built or sourced to deliver a credible end-to-end solution.

Offering and workflow design — collaborating with our solution engineering and delivery teams, as well as external advisors, to design the full service stack: from field data capture (sensors, cameras, real-world environments) through annotation, quality control, and delivery of production-ready datasets.

Tooling and stack recommendation — evaluating and recommending the tools, platforms, and processes that should underpin the offering, with a view to what's scalable and defensible.

Pilot execution — contributing to the design and, where feasible, the execution of a small-scale data collection pilot in a real robotics environment, to validate assumptions and stress-test the proposed workflow.

Expected deliverables

By the end of the engagement, the core outputs are: a structured market and competitive benchmark, an internal capability gap analysis, a documented end-to-end service playbook covering workflows, tooling, roles, and quality standards, and a stack recommendation with rationale. These outputs should be ready to inform both internal operations and external client conversations.

How you'll work

You'll be supervised directly by the founding partners and work day-to-day with our solution engineering and delivery teams, as well as external consultants and advisors. This is a hands-on, cross-functional role with direct exposure to strategic decision-making.
